

PC Clock

On-Line Operation, Desktop Convenience

- Eliminates Manual Data Collection Errors
- Runs On Your Existing Network
- Saves Money Over Conventional Time Clocks
- Real-Time Data & Input Validation
- User Programmable

Accurate, reliable data

Time America's PC Clock records employee time, monitors productivity, control access and tracks inventory in a multitude of industries such as retail, health care services, banking, manufacturing, hospitality and many others.

PC Clock is a user friendly data collection point for employee information. It can run on a variety of existing computer networks in your organization to complement the management information systems you already have in place. By automating your data collection process, you can reduce the manpower and mistakes associated with conventional time cards thereby improving your bottom line.

Employees simply enter information through the computer keyboard or optionally via kiosk. Employee feedback is provided through audible accept/reject tones and displayed messages. PC Clock automatically validates job costing entries. When an employee keys or swipes an ID number, it is compared against the database to ensure validity. Additionally, PC Clock will notify you if an invalid entry is made and display the employee name associated with that entry.

Functionality of your PC Clock is programmed by using your time and attendance system database. Each of its 12 function keys can be programmed to request up to four levels of information. Each piece of information can be validated. PC Clock can be programmed to prompt employees for data input, display employee name, validate job costing entries, and much more.

Put the power of automated data collection to use in your business today!
